1. Amendments filed 9/29/06 and 12/22/06 have been entered. Claim 6 is

cancelled. Claims 1-5 are pending.

2. The IDS filed 9/29/06 has been entered and considered.

3. The second declarations of Paul Polakis filed 9/29/06 has been entered

and considered. The declarations of Randy Scott filed 9/29/06 has been entered

and considered.

EXAMINER'S AMENDMENT

4. An examiner's amendment to the record appears below. Should the

changes and/or additions be unacceptable to applicant, an amendment may be

filed as provided by 37 CFR 1.312. To ensure consideration of such an

amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone

interview with AnneMarie Kaiser on 3/5/07.

Replace the Priority information paragraph following the Title with:

RELATED APPLICATIONS

This application is a continuation of, and claims priority under 35 USC §

120 to, US Application 10/006867 filed 12/6/2001, now US Patent No. 7,160,985.

which is a continuation of, and claims priority under 35 USC §120 to, PCT

Application PCT/US00/23328 filed 8/24/2000, which is a continuation-in-part of,

Application/Control Number: 10/063,587

Art Unit: 1646

and claims priority under 35 USC §120 to, US Application 09/403297 filed 10/18/1999, now abandoned, which is the National Stage filed under 35 USC §371 of PCT Application PCT/US99/20111 filed 9/1/1999, which claims priority under 35 USC 119 to US Provisional Application 60/099741 filed 9/10/1998.

Amend the Title on page 1 as follows:

Secreted and transmembrane polypeptide and nucleic acids encoding the same PRO1357 Antibodies

- 4. Claims 1-5 are allowed.
- 5. The following is an examiner's statement of reasons for allowance:

The claims of the instant invention are directed to an isolated an isolated antibody that specifically binds to the polypeptide of SEQ ID NO:78. The specification provides several asserted utilities at page 93, including that the PRO polypeptides of the present invention may be differentially expressed in a diseased tissue as compared to a normal tissue of the same tissue type.

Applicant states at page 5 of their response (9/29/06) that the gene expression data in the specification, Example 18, shows that the mRNA associated with the PRO1357 polypeptide was more highly expressed in normal stomach and kidney tissue compared to stomach and lung tumor tissue. Gene expression was analyzed using standard semi-quantitative PCR amplification reactions of cDNA libraries isolated from different human tumor and normal human tissue samples. Identification of the differential expression of the

Application/Control Number: 10/063,587

Art Unit: 1646

PRO1357 polypeptide-encoding gene in tumor tissue compared to the corresponding normal tissue renders the molecule useful and enabled as a diagnostic tool for the determination of the presence or absence of tumor.

Example 18 at page 140 of the instant specification demonstrates differential expression of PRO1357 cDNA using quantitative PCR amplification reactions. DNA64881-1602 was shown to be more highly expressed in normal stomach and kidney tissue as compared to stomach and lung tumor tissue in this Example. Applicant states at page 8 of the response 4/10/06) that Example 18 utilizes a more accurate and reliable method of assessing changes in mRNA levels, namely quantitative PCR analysis. Applicant relies on more than 140 references (see IDS filed 9/29/06, 4/10/06), where expression levels of mRNA, measured by quantitative PCR, were found to have a good correlation to the expressed protein levels.

It had been previously argued in the Office action mailed 6/27/06 that mRNA levels were not predictive of protein levels, a number of references were cited. However, these references were measuring and analyzing mRNA levels using microrarrays, not using quantitative PCR analysis and the art recognizes that the results obtained by microarray are not always the same as the results obtained using quantitative PCR (for example, see Oda et al. Virchows Arch. 430: 99-105, 1997, specifically page 104, column 1, paragraph 2). While the PTO found several references in which the protein expression levels did not correlate with mRNA levels measured by quantitative PCR (for example, see Anderson et al., Electrophoresis, Vol. 18, pages 533-537, 1997), the majority of

Art Unit: 1646

the references which were found, including those cited by Applicant, demonstrated a correlation between mRNA levels measured by quantitative PCR and protein expression levels.

Applicant asserts that the expression levels of protein correlate to mRNA (cDNA) levels when the cDNA is measured by quantitative PCR (i.e. rtPCR). Applicant has provided more than 140 references in support of this position. The prior art of record argued by the Examiner, is not specifically directed to message levels measured by rtPCR. Based on the totality of evidence of record, one of skill in the art would find it more likely than not that an increase in message as measured by rtPCR would be predictive of an increase in protein expression levels, absent evidence to the contrary. Therefore, the data presented in Example 18, which demonstrates differential expression of nucleic acids encoding PRO1357 also supports a conclusion of differential expression of the PRO1357 polypeptide. Therefore, one of ordinary skill in the art would be able to use the PRO1357 polypeptide diagnostically for distinguishing stomach and lung tumor from normal stomach and lung tissue, as asserted by Applicant.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
